The Future of the Public's Health

Cancer as a Complex Adaptive System

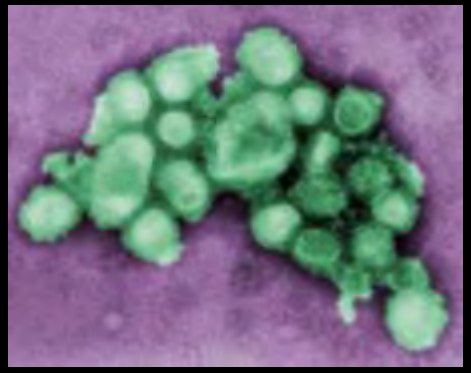
The Difference Between Complicated Systems and Complex Adaptive Systems

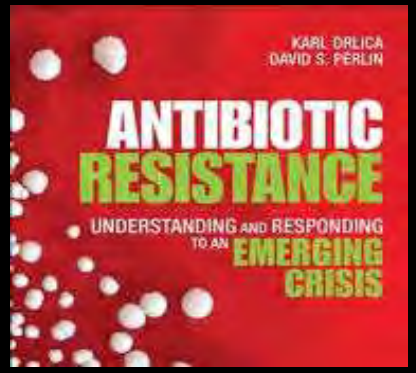
Complicated Systems: Human Design and Engineering

- behavior of the assembled system is predictable from the properties of the components
- proactive awareness of tolerance limits and most likely failure points
- system performance is fixed and not capable of autonomous evolution
- low degrees of design freedom

Complex Adaptive Systems:
Fundamental and Ubiquitous Design Principals of Natural Systems

weather/climate	epidemics/ pandemics	disease pathogenesis	Rx resistance



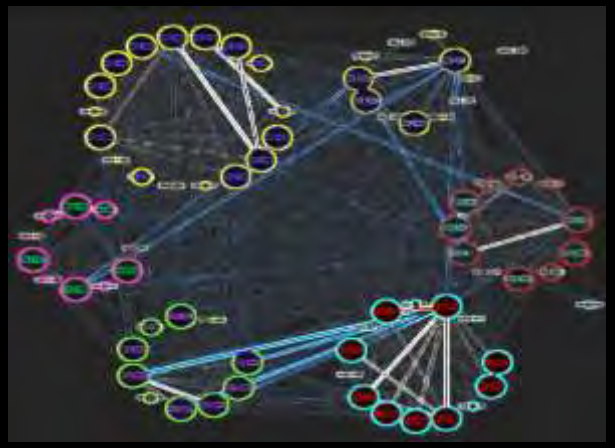


- system behavior not predictable from knowledge of the properties of individual subcomponents
- dynamic behavior defined by constantly changing interactions between components in response to external inputs
- robust, adaptive, evolvable

Complex Adaptive Systems in Biology: Robustness, Adaptation and Evolvability in the Architecture of Molecular (Informatics) Networks

stable networks
(health: physiology)

perturbed networks
(disease: pathophysiology)



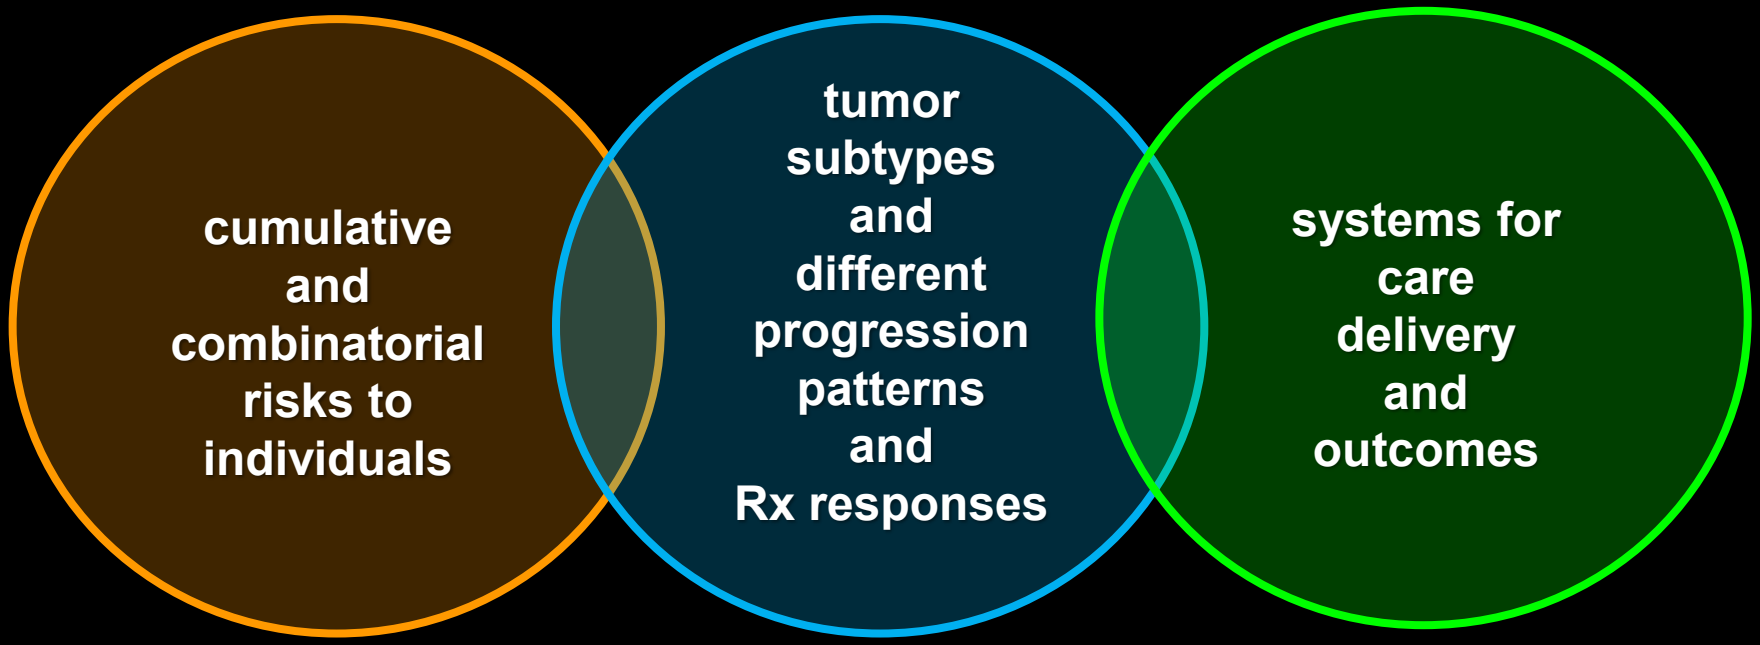
dynamic attractor landscapes of state spaces

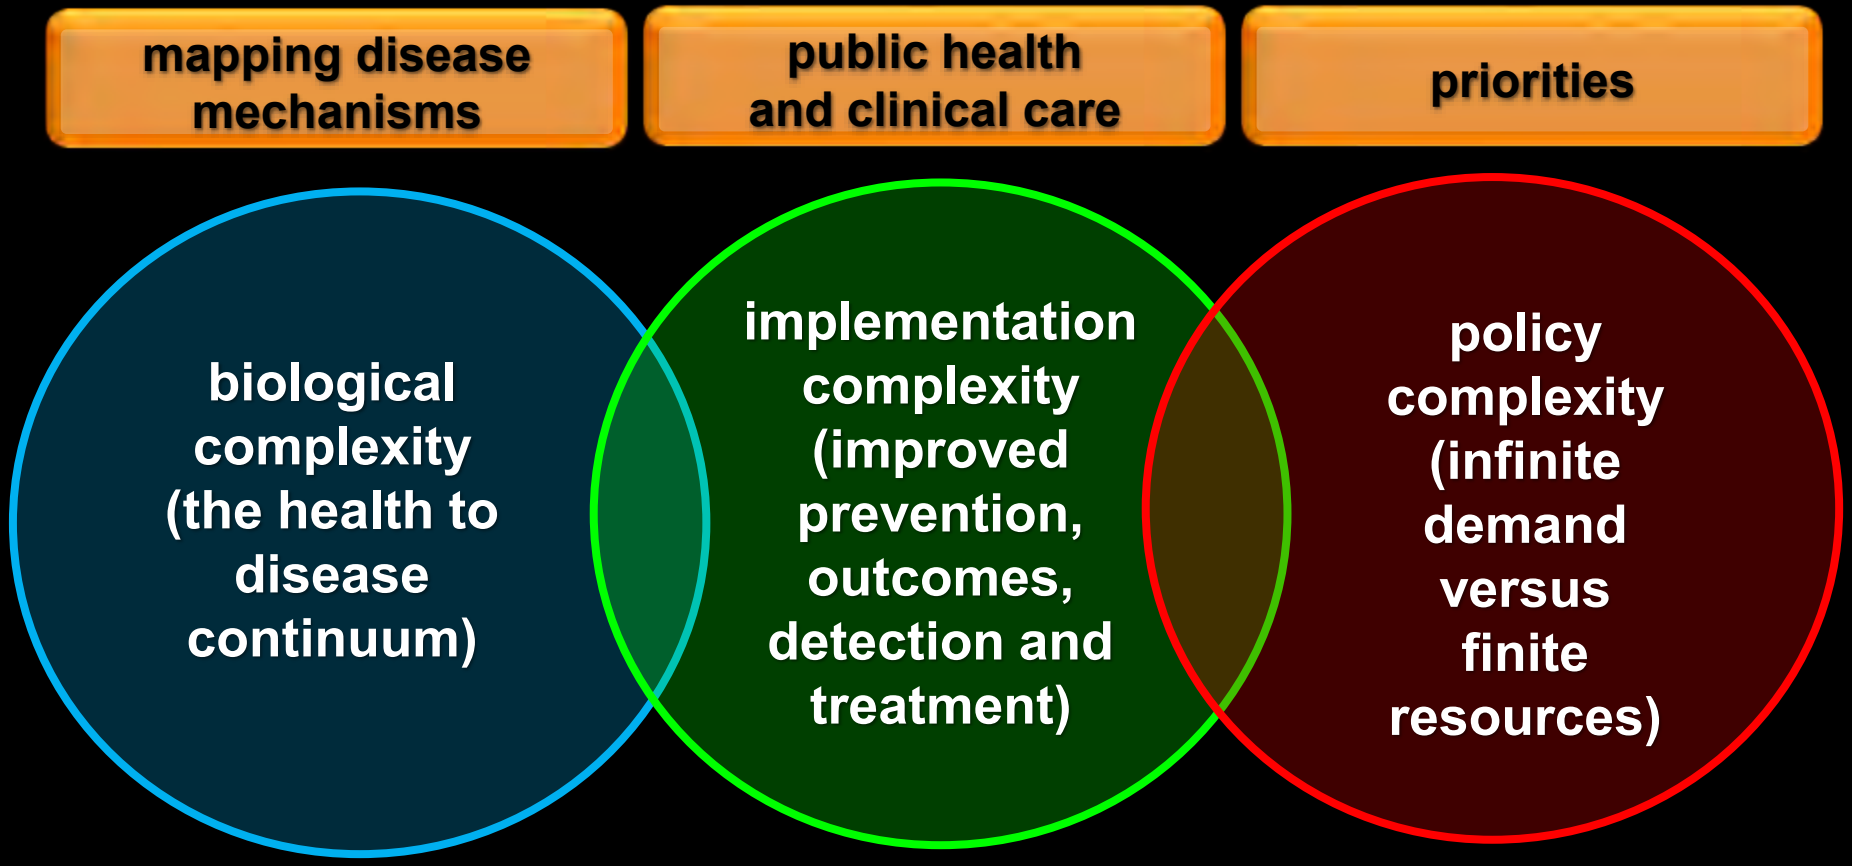
- network structure robust to commonly encountered perturbations (homeostasis)
- fragile to novel perturbations that an trigger major changes in system states (emergence)

The Challenge for Comprehensive Cancer Control

- addressing cancer as a complex adaptive system (CAS)
- cancer is a **biological CAS** embedded within a constellation of multiple other complex adaptive systems (**life style, environmental exposures, patterns of clinical care, rate of innovation, public and payer policies**) whose interactions influence disease risk and the evolutionary dynamics of disease emergence and progression

Cancer as a Multi-Dimensional Dynamic Interaction Between Multiple Complex Adaptive Systems



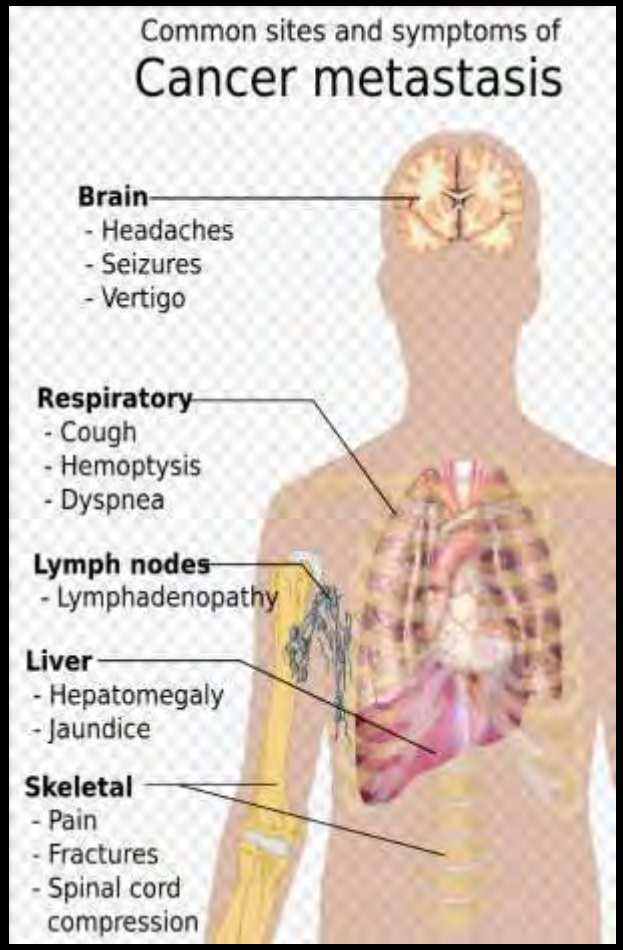


- public and political expectancy of meaningful progress
- aging demographics, escalating disease burden, insufficient clinical infrastructure and economic unsustainability
- political, ethical and legal implications of cost of care and future potential limits on care services

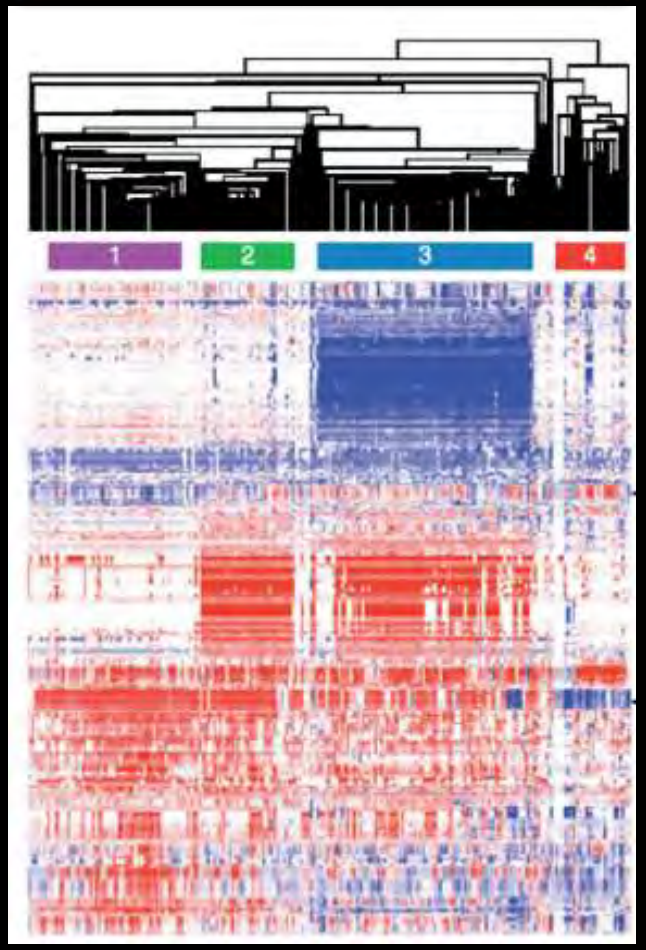
The Path to Precision Oncology:

Superstitions

Symptoms



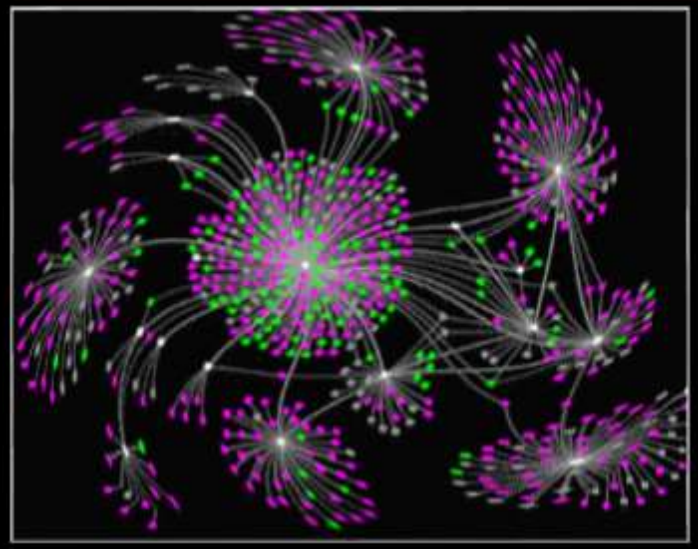
(Molecular) Signatures



Precision Oncology

(Epi)Genomics

Causal Relationships Between Disruption of Molecular Signaling Networks and Disease



- terabytes per individual
- zettabyte – yottabyte population databases

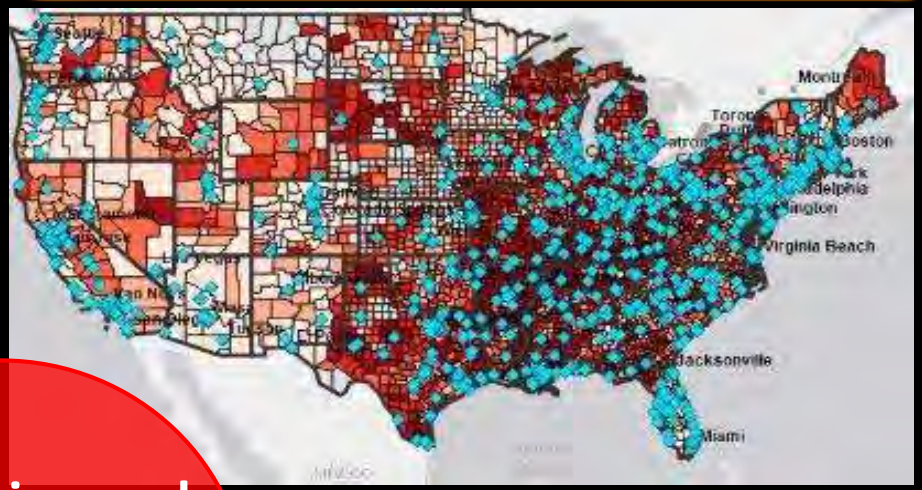
Patient-Specific Signatures of Predisposition to Disease or Overt Disease

Big (Messy) Data

Precision Medicine:
"Computed Phenotypes" and 'Digital Siblings'

Individual Data

Population Databanks



integration and analysis of large scale, diverse data categories

"matching" individuals to 'best match' cohorts using data on similarities of deep phenotyping profiles and treatment outcomes

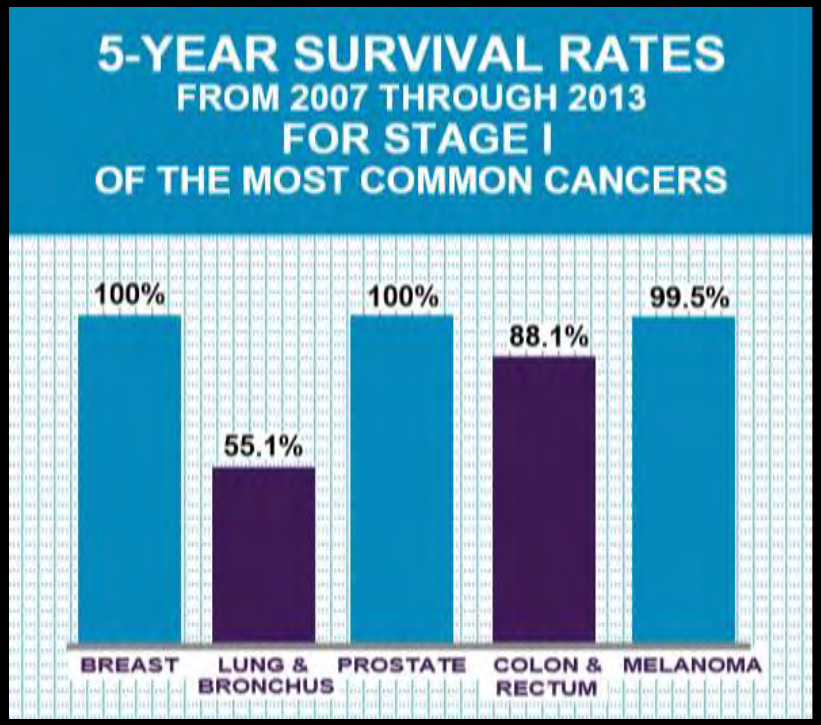
NPCR

NATIONAL PROGRAM of CANCER REGISTRIES



Public Health Approaches to Cancer Prevention and Early Disease Detection

- historical focus on generic risk assessment tools and monitoring
  - sex or age categories
  - specific socio-cultural and environmental exposure risk cohorts
  - limited subpopulation analytics and variable screening intervals
- need for improved assimilation of new molecular insights in risk factor identification to increase precision and sensitivity of existing approaches
  - molecular exposures, including infectious agents
  - social media and behavioral/lifestyle factors

Estimated New Cancer Cases and Deaths – 2018

cases
1,735,350

deaths
609,640

Estimated New Cases

Male			Female		
Prostate	164,690	19%	Breast	[illegible]	30%
Lung & bronchus	121,680	14%	Lung & bronchus	112,350	13%
Colon & rectum	75,610	9%	Colon & rectum	64,640	7%
Urinary bladder	62,380	7%	Uterine corpus	63,230	7%
Melanoma of the skin	55,150	6%	Thyroid	40,900	5%
Kidney & renal pelvis	42,680	5%	Melanoma of the skin	36,120	4%
Non-Hodgkin lymphoma	41,730	5%	Non-Hodgkin lymphoma	32,950	4%
Oral cavity & pharynx	37,160	4%	Pancreas	26,240	3%

"People Analytics"
Social Activities and Behavior Become Quantifiable

- who knows why people do what they do?
  - the fact is that they do!
- these actions can now be traced and measured with unprecedented precision
- with sufficient data, the numbers reveal increasingly predictable behavior, individual risk patterns and health events
- the confessional of social media and the blurring of private and public spaces
- voluntary vs involuntary data capture
- complex ethical and legal issues
  - consent, privacy, security, surveillance

Major Investments in Digital Health by Major Corporations From Within and Outside of Traditional Healthcare Services

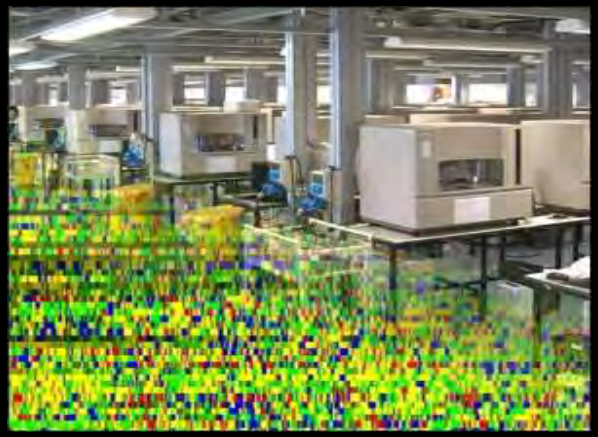
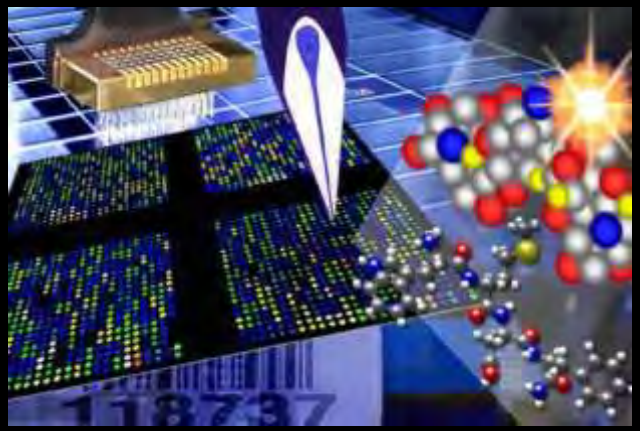
A New Era of Massive Expansion of Molecular Profiling Data (Multi-Omics)

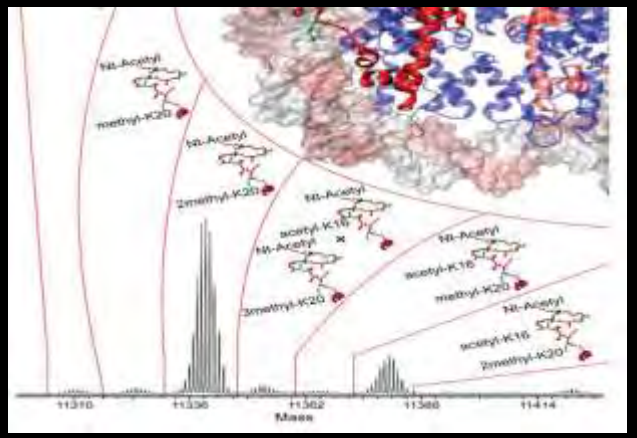
(Epi)Genomics

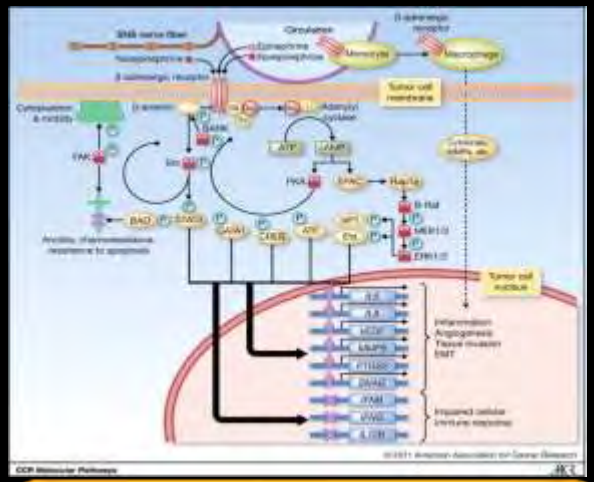


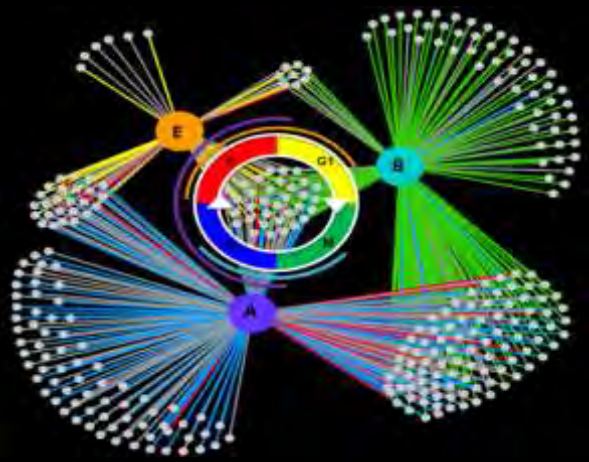
Transcriptomics

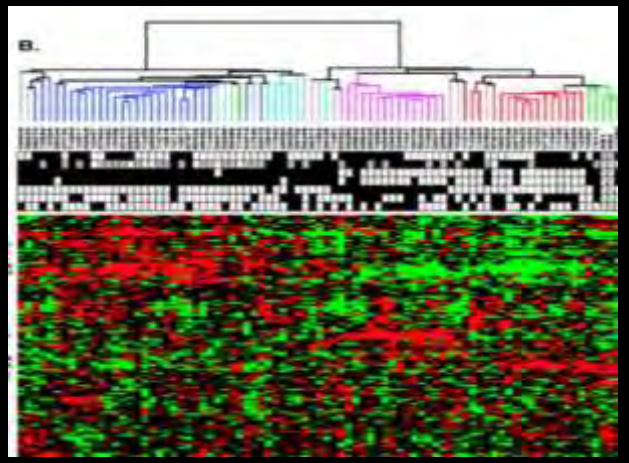


Proteomics







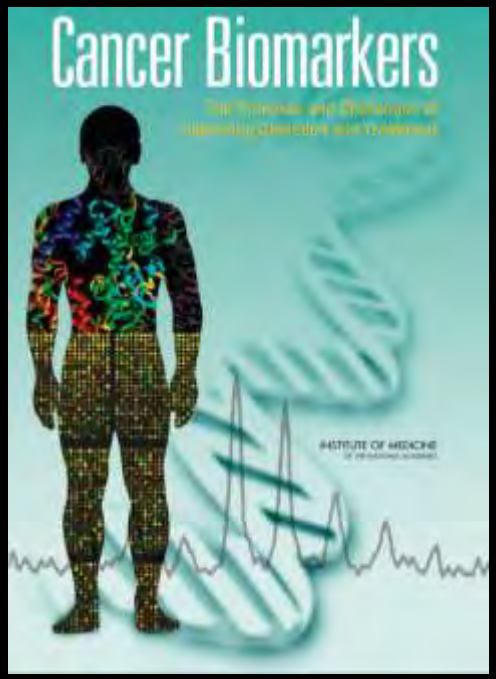


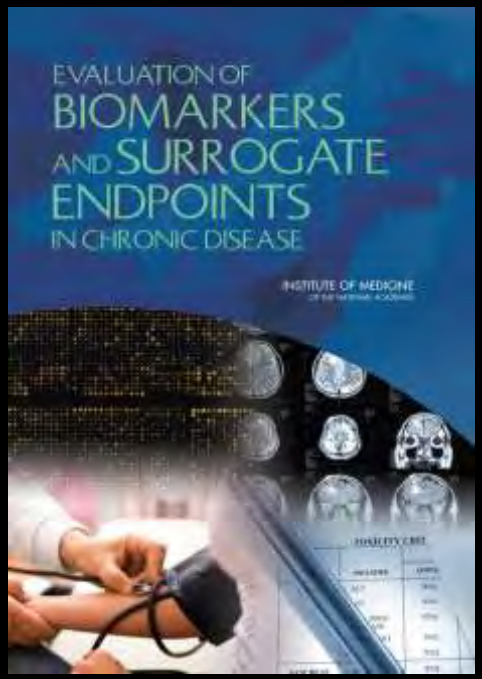
Molecular Interactions and Pathway Analysis

Network Topology and Architecture

Network Perturbation(s) and Disease Subtypes

Biomarkers:
The Core Technology Component of Precision Oncology





- disease predisposition markers
- molecular taxonomy of cancer subtypes
- new clinical trial designs
- companion Dx for target-centric Rx choice
- prediction of Rx response/resistance

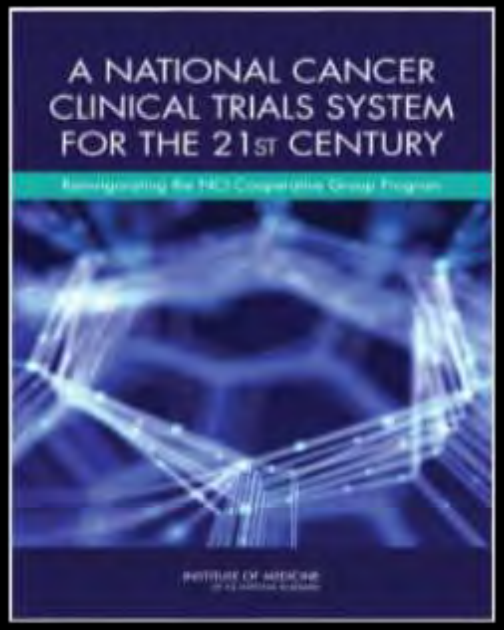
Biomarkers:
The Core Technology Platform in Making Precision Oncology a Reality

- profound mismatch between intellectual rationale and limited availability of validated biomarkers
- poor productivity and reproducibility of biomarker research (publish and vanish)
- insufficient R&D investment (public and private sectors)
- escalating cost of trials for multiplex biomarker validation and reimbursement barriers
- insufficient minimally invasive/imaging technologies for dynamic longitudinal monitoring of health to disease continuum profiling
  - static snapshots of dynamic disease progression
  - promise of liquid biopsy (ctDNA, CTC) not yet validated

Incidence of Biomarkers for Cancer Subtype Profiling for the Selection of Rx Biomarker-Driven Rx Selection (2017)

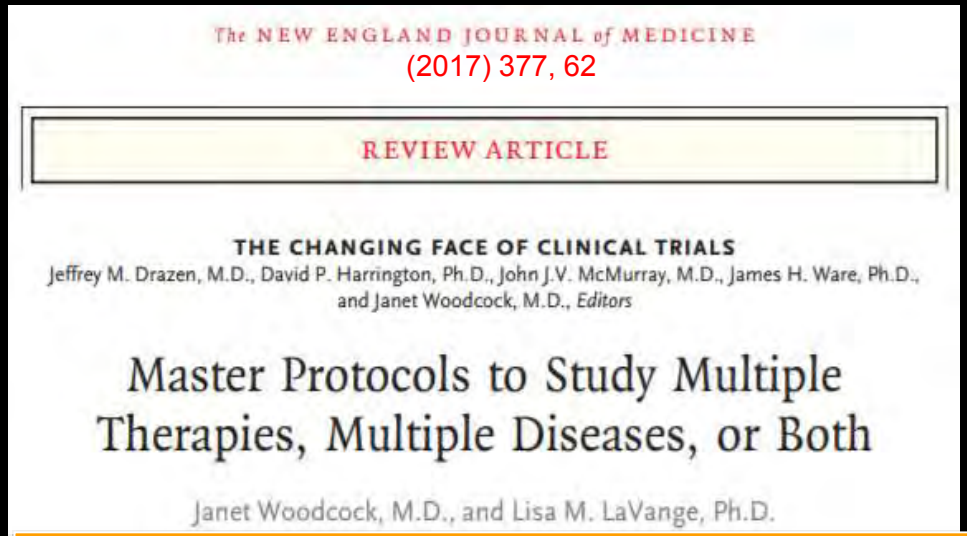
Source: FDA.gov and Drugs@FDA, Apr 2018; IQVIA, ARK R&D Intelligence, Apr 2018; IQVIA Institute, Apr 2018

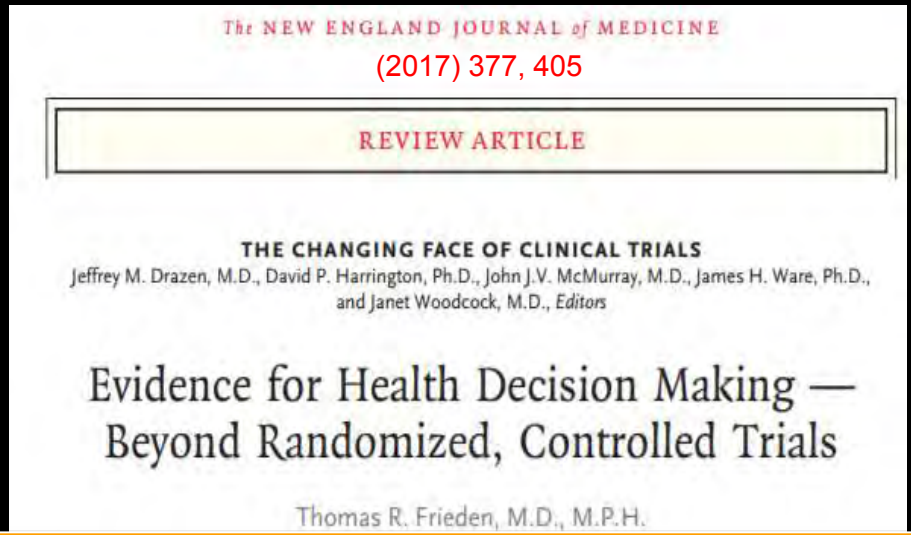
Molecular Biomarkers Classification of Tumor Subtypes and New Clinical Trial Designs



- cost, time and inefficiency (failure) of RCTs
  - test and control arms of large patient cohorts (3000 plus) without biomarker segmentation into subtype cohorts
  - legacy of “one-size-fits-all” Rx strategy
  - economically unsustainable
  - too many trials, too few patients, slow enrollment
  - increased payer requirements for concordance with RWE

Precision Medicine and New Clinical Trial Designs





From RCT to Adaptive, Basket, Umbrella Trials and New Approaches to RWE Observational Trials and Registries

Parallel Co-Development of Companion and Complementary Diagnostics

Tissue-Agnostic Anti-Cancer Drugs in Clinical Trials

Agent	Company	Target	Indication	Status
Pembrolizumab	Merck & Co.	PD1	MSI-H (MMR-deficient) solid tumours	Approved
Larotrectinib	Loxo Oncology, Bayer	TRK	Solid tumours with NTRK fusions	NDA
Entrectinib	Ignyta, Roche	TRK, ALK, ROS1	Solid tumours with NTRK fusions	Phase II
Merestinib	Eli Lilly	MET, TRK	Solid tumours with NTRK rearrangements	Phase II
Atezolizumab	Genentech/Roche	PDL1	Solid tumours with MSI-H, high mutation burden or alterations in DNA proofreading genes	Phase II
TPX-0005	TP Therapeutics	TRK, ALK, ROS1	Solid tumours with NTRK, ALK and ROS1 rearrangements	Phase I/II

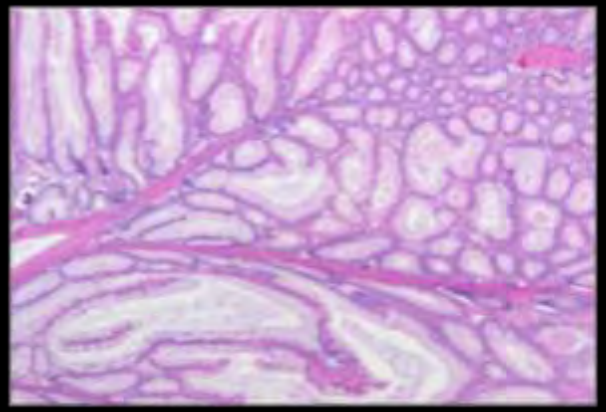
The Need for Rethinking Therapeutic Strategies to Combat Cancer

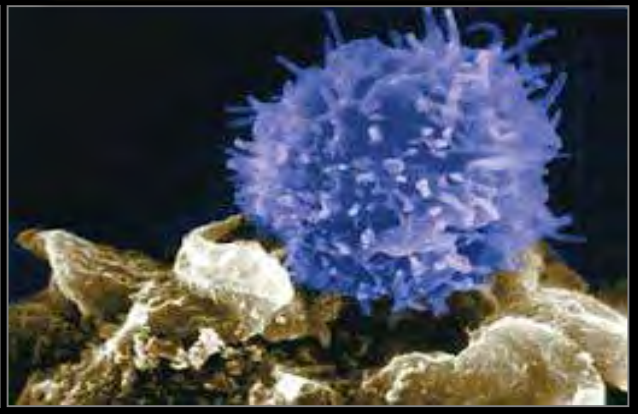
The Complex Biology of Cancer Progression and Treatment Resistance

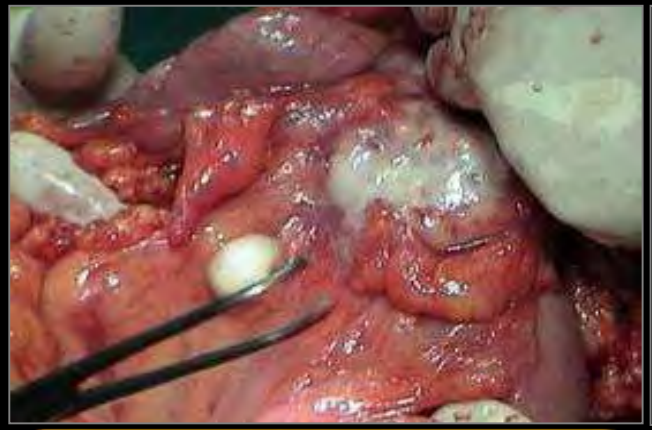
Escape From Controls for Normal Tissue Architecture

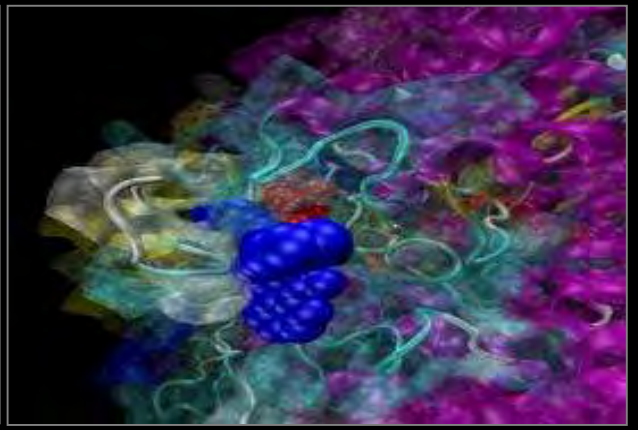


Genome Instability and Emergence of Clonal Variants

Evasion of Detection/ Destruction by Host Immune System







Use of Host Systems to Promote Progression

Invasion and Metastasis

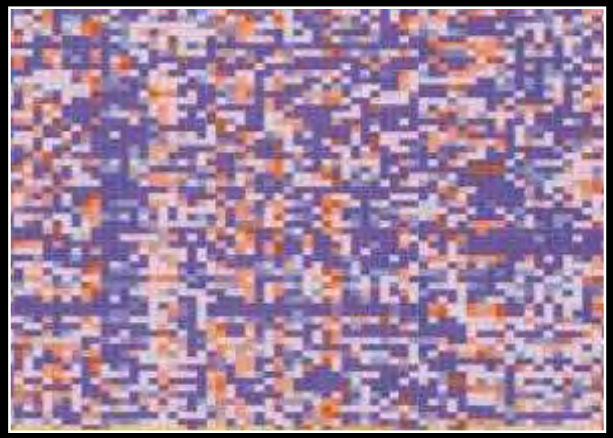
Emergence of Drug-Resistant Clones

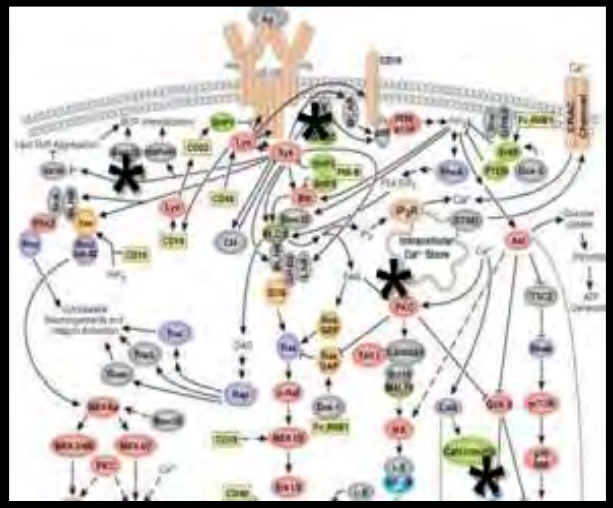
Targeted Therapeutics and the Omnipresent Problem of R_x Failure Due to Emergence of Drug Resistance Clones

Molecular Subtyping and R_x Targets

Initial R_x - Response to Targeted R_x

R_x - Resistance via Redundant Molecular Pathways





B = 15 weeks R_x (vemurafenib)

C = 23 weeks R_x and emergence of $MEK1^{C121S}$ mutant

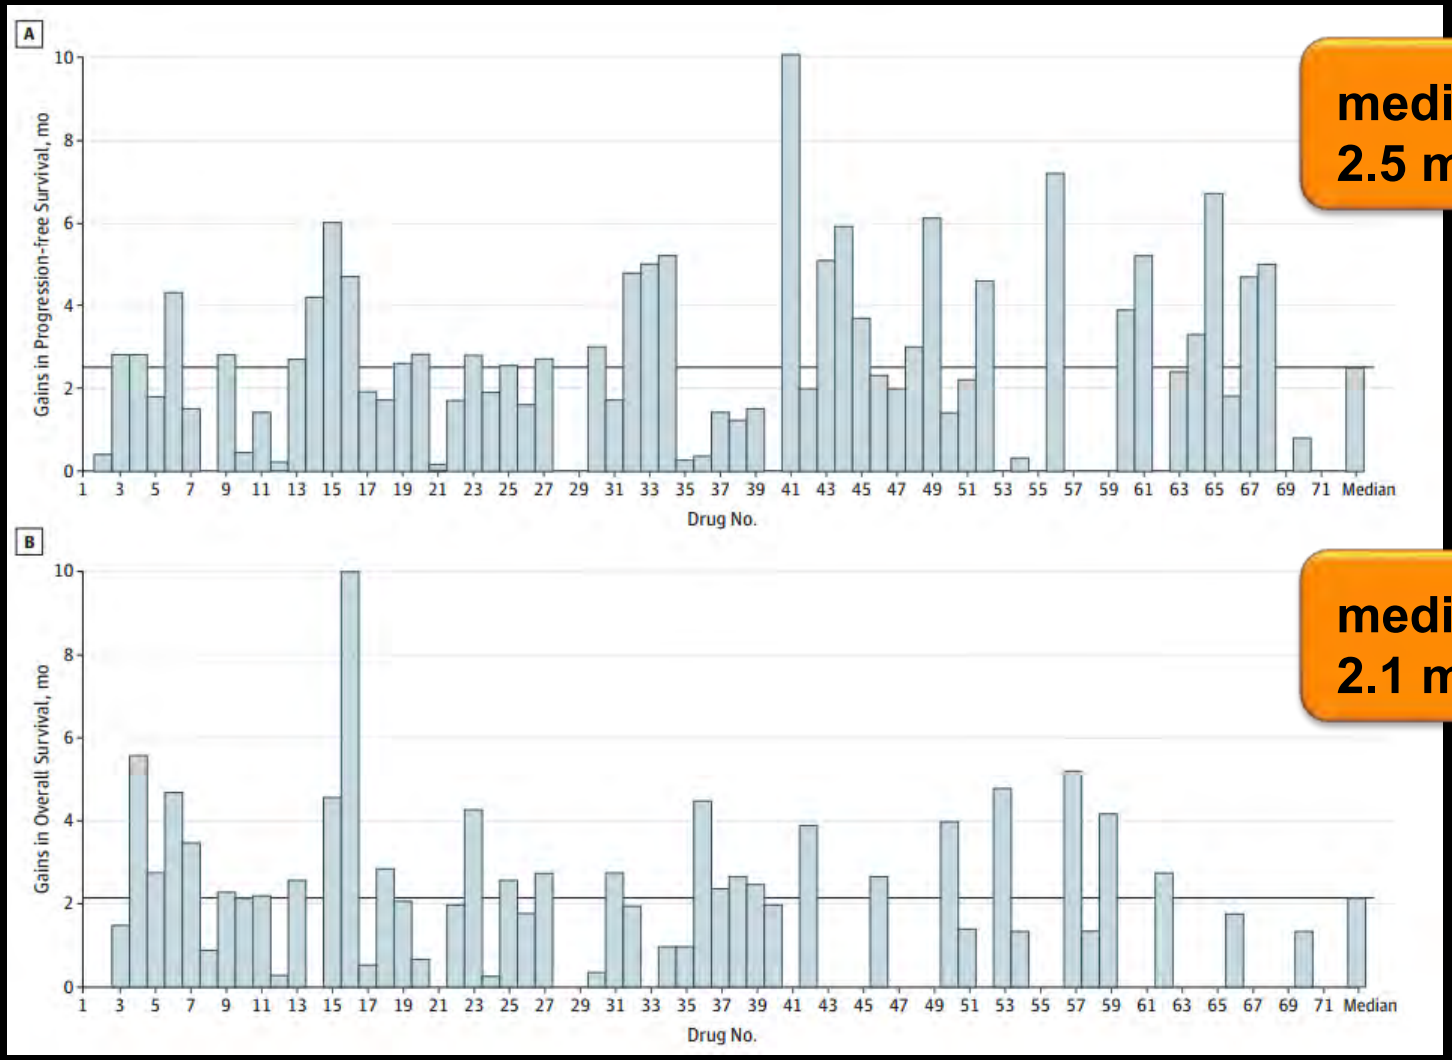
Wagle N, et al. *J Clin Oncol*. 2011;29(22),3085-3096.

Cancer R_x: Ugly Realities

- in the majority of cancers the efficacy of R_x therapies (except immunotherapies) is either short-lived or completely ineffective
- mutations that confer R_x resistance may pre-exist prior to treatment (intrinsic resistance) or arise during treatment (acquired resistance)
- mutations are typically present in multiple pathways
- intrinsic and/or acquired mutations in non-targeted pathways can enable 'by-pass' signaling circuits that ensure tumor cell survival and ever-broadening resistance R_x spectrum

Performance Comparison for New Anti-Cancer Drugs Approved 2002-2014 for Top Ten Pharmaceutical Companies

Gains in Progression-Free Survival (PFS) and Overall Survival (OS) for 71 Drugs Approved by the FDA From 2002 to 2014 for Metastatic and/or Advanced and/or Refractory Solid Tumors



median 2.5 months

median 2.1 months

From: T. Fojo et al. (2014) JAMA Otolaryngology–Head & Neck Surgery 140, 1225

What Is a Meaningful Clinical Outcome (Benefit)?

- performance (outcomes) of FDA-approved anti-cancer drugs (excluding immunotherapy)
- 71 Rx for solid tumors 2002 to 2012[a]
  - median PFS (2.1 months) and OS (2.3 months)
- 47 Rx 2014-16[b]
  - only 19% met ASCO modest OS benefit criterion
- ESMO analysis of 226 randomized trials[c]
  - only 31% met meaningful benefit criteria

a = T. Fojo et al. (2012) JAMA Otolaryngol. Head Neck Surg. 140, 1225
b = H. Kumar et al. (2016) JAMA Oncology 2, 1238
C = J. C. Del Paggio et al. (2017) Ann. Oncol. 28, 157

Aspirations for Improved Cancer Treatment

- how to maximize the efficacy and safety of therapeutic interventions against advanced (metastatic) disease
  - circumventing variability in tumor cell clones to the selected R_x regimen (overcoming the heterogeneity problem)
  - dynamic monitoring of changing clonal dynamics during treatment for faster detection of drug-resistant clones and more agile, anticipatory shifts in R_x regimen
  - mobilization (reactivation) of immune defenses to detect and destroy all clones

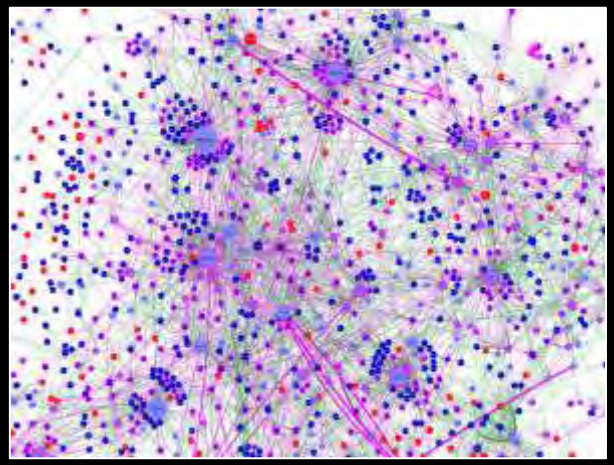
Dynamic Modeling of Signaling Pathways and Networks in Complex Systems

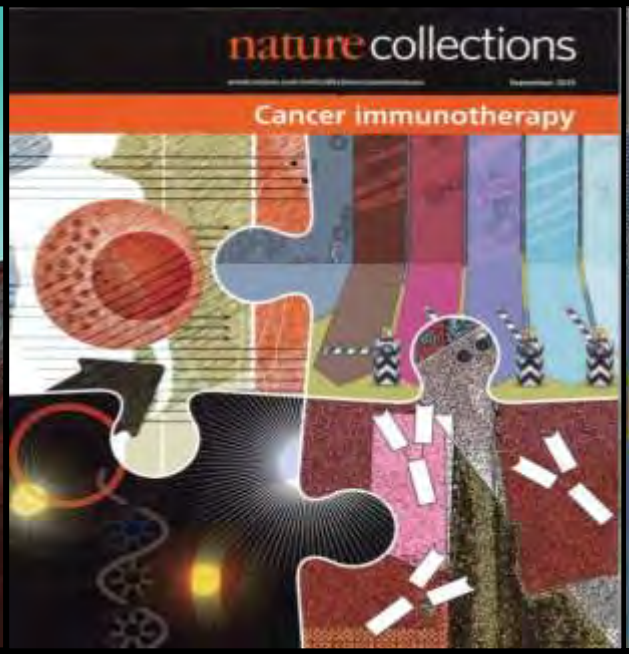
- what parts of the system and the subsystem networks are the most/least sensitive to perturbation?
- what part(s) of the network(s) are most/least influential on the rest of the network when perturbed?
- exploitation to identify new R_x targets and prediction of most likely trajectories of R_x resistance

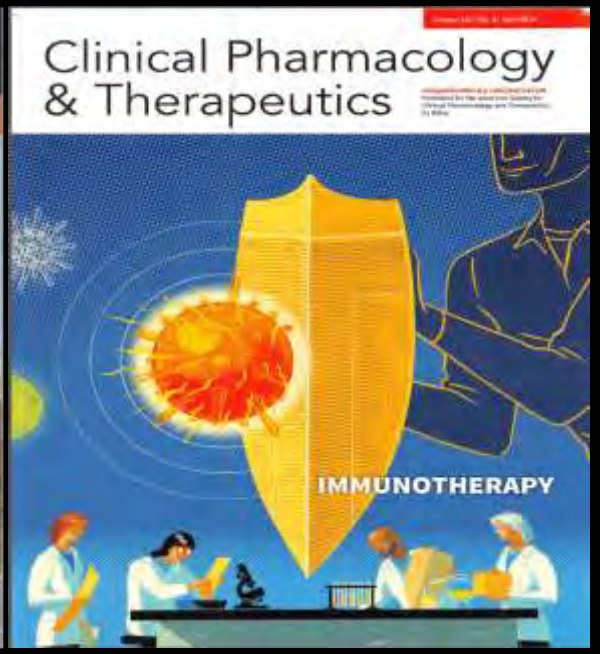
A Disturbing Question:
Is Unifocal R_x Modulation of Complex Network Dysregulation in Advanced Chronic Diseases Feasible or a Delusion?



- "too disrupted to restore"? (homeostatic reset) ?
- multi-node/multi-module/ multi-subnetwork dysregulation
- low feasibility of multi-R_x intervention against multiple dysregulated targets ?
- even lower feasibility of design of promiscuous multi-target single R_x ?

The Promise of Cancer Immunotherapy





Cancer Immuno-Oncology (I/O) Therapies in Clinical Trials (4/18)*

- over 300 investigational therapies and 1700 clinical trials
- late stage Phase II/III pipeline dominated by agents with 4 MOAs
  - anti-CTLA4, anti-PDI, anti-PD-LI, CD19 modulation (CAR-T cells)
- enthusiasm for indoleamine-pyrole-2, 3 dioxygenase (INDO/IDO) inhibitors dashed and recent corporate withdrawals (4/18)
- additional 52 immune-targets under investigation

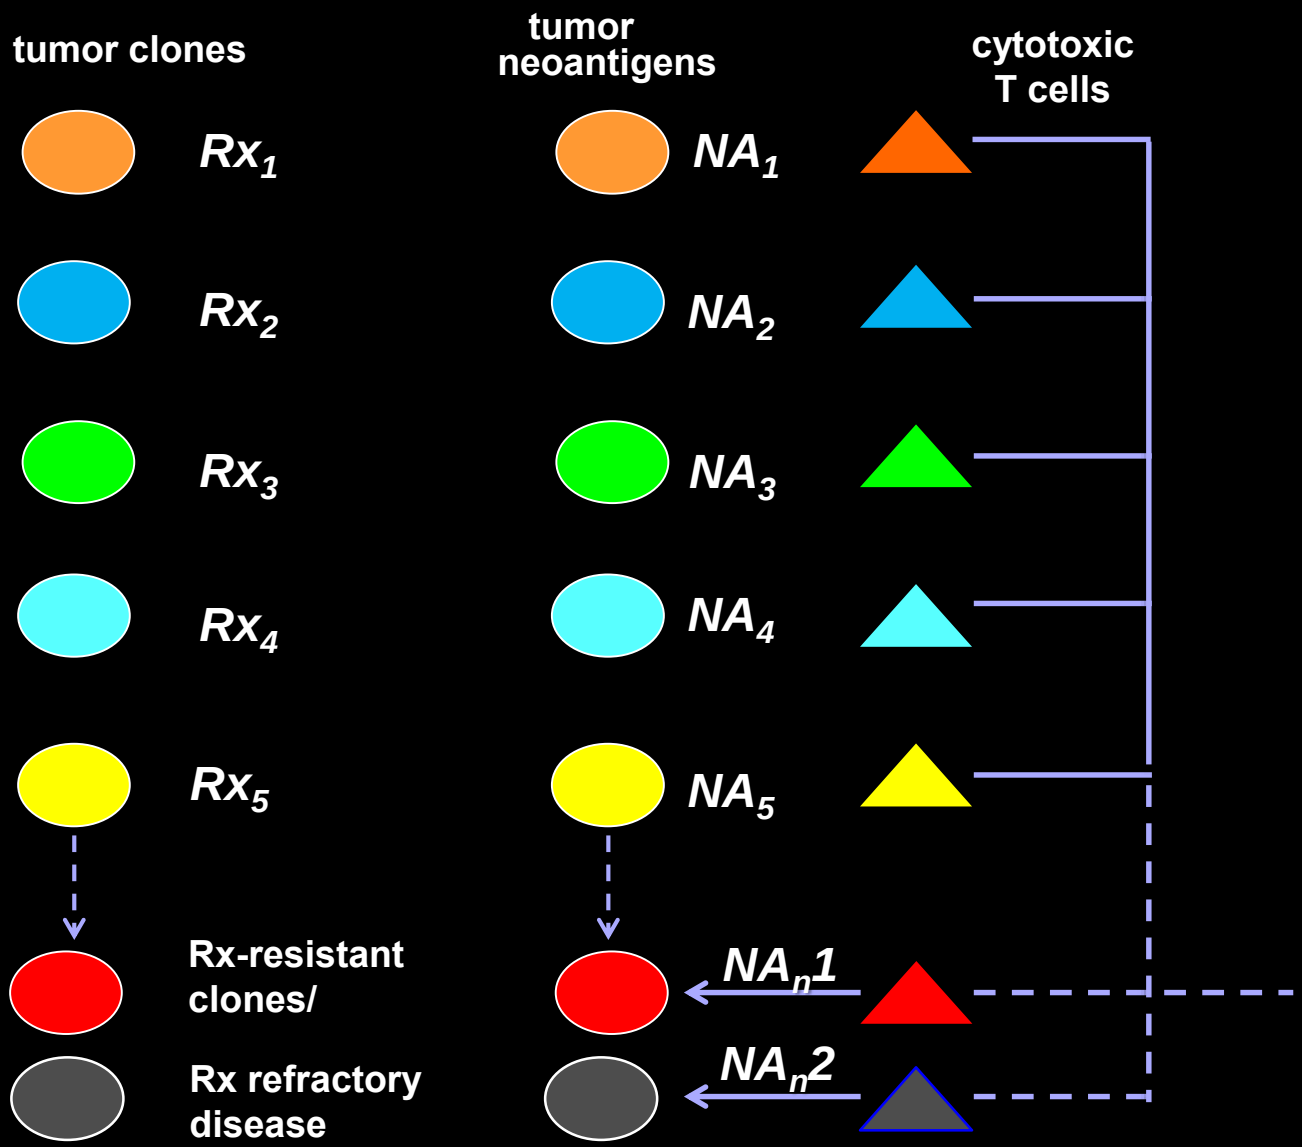
Circumventing the Inevitable Drug Resistance Problem in Targeted Rx Therapy versus Therapeutic Restoration of Effective Immune Surveillance



adaptive evolution of immune response and expanded cytotoxic T cell responses

Realizing The Promise of Cancer Immunotherapy

- wide variation in R_x response rates
  - only 20 - 40% positive responses even in the most responsive tumors
- lack of diagnostic tests to reliably predict responder vs. non-responder patients
- improving response rates across all malignancies and all stages
- will I/O combinations increase response rates?

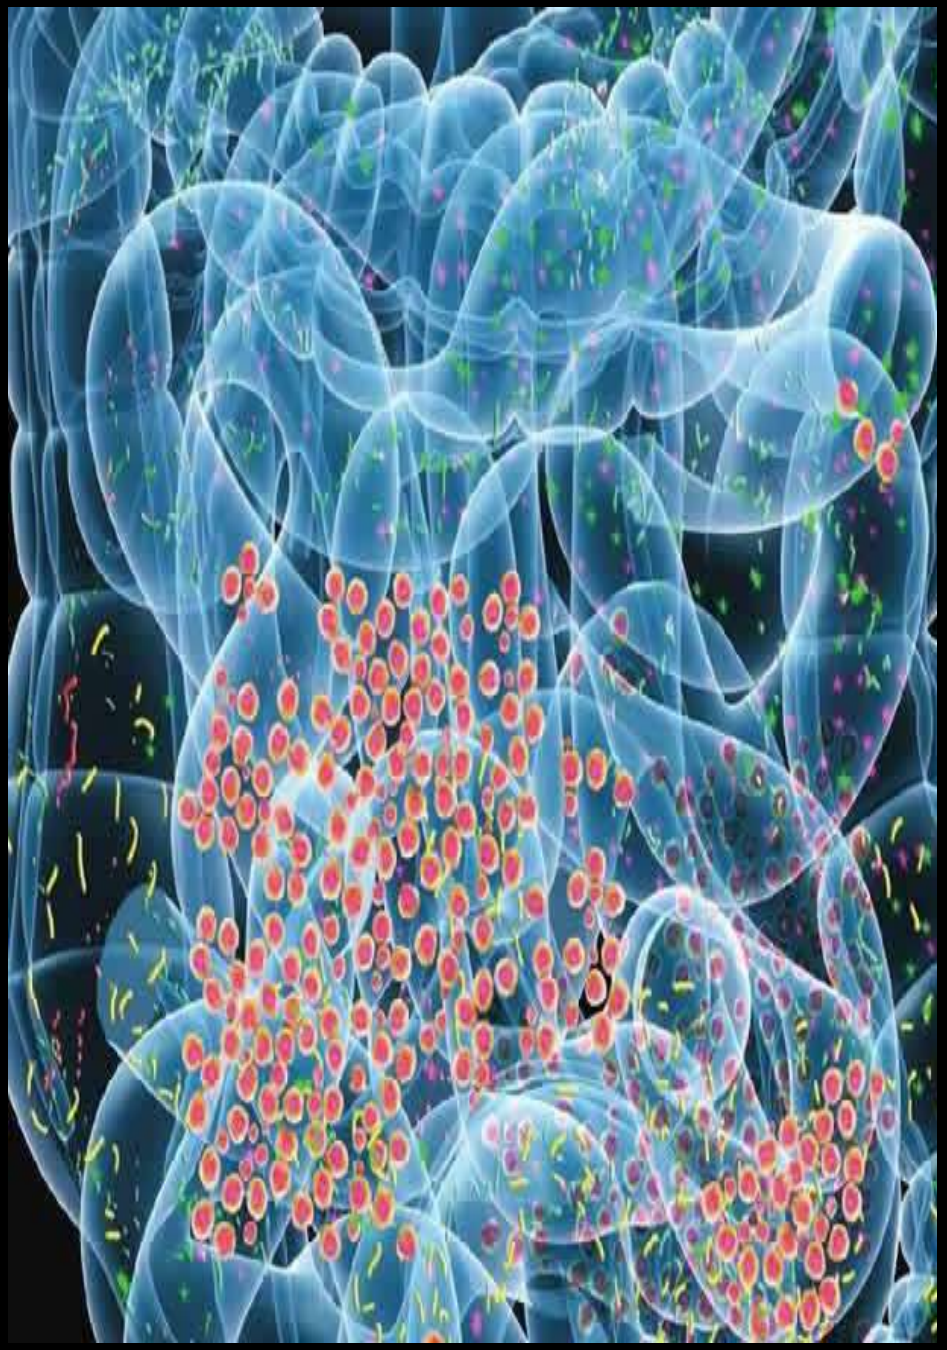
GUT MICROBES AND CANCER

The microbiome influences patient response to immunotherapy

pp. 32, 91, 97, & 104



The Promise of Immunotherapy: Is Widespread Adoption Economically Feasible?

- unit Rx cost ($100 - 400K)
- indirect care cost
- escalating cost of combination Rx regimens
- extravagant cost of cell-based therapies ($500K - $1.5 million)
- complex clinical management challenges and compatibility with community oncology services?

Understandable Enthusiasms But With Risk of Considerable Waste in Patient Resources and Cost

- proliferation of I/O combination trials absent biological rationale for dose selection, sequence, timing, number of cycles and duration
  - I/O : I/O
  - I/O : chemo -
  - I/O : targeted Rx
  - I/O : oncolytic viruses
- patient expectations
  - informed consent vs informed risk
- market saturation and performance-based pricing?

Incorporation of AI could transform cancer diagnosis in UK - PM May

NHS

May 21, 2018

Br Dr Ananya Mandal, MD

According to Prime Minister Theresa May, Artificial Intelligence (AI) is soon to change the scene in cancer and other disease diagnosis. She is to speak today in Macclesfield where she would acknowledge AI as a "new weapon" that is being used by the NHS and technology companies in research.

"I don't think any physician today should be practicing without artificial intelligence assisting in their practice.

It's just impossible otherwise to pick up on patterns, to pick up on trends to really monitor care."

Bernard J. Tyson
CEO, Kaiser Permanente

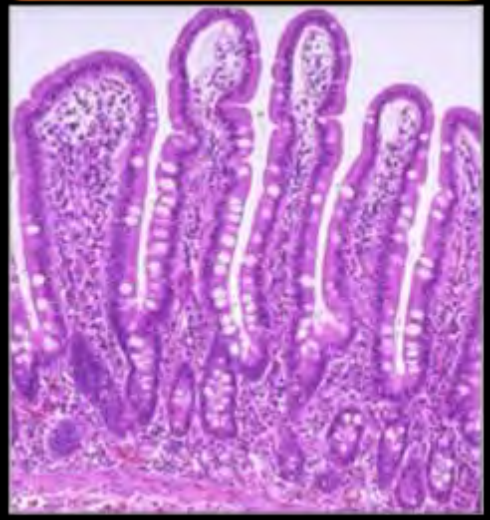
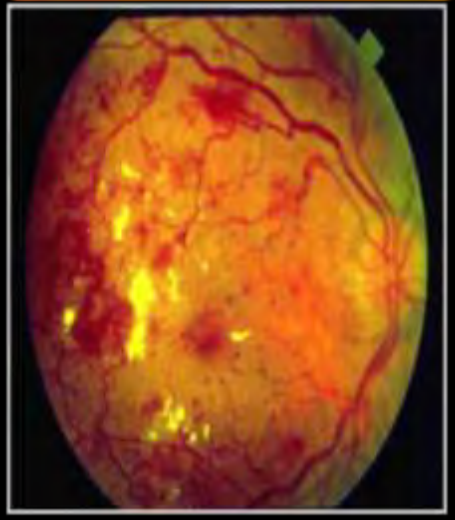
Just What the Data Ordered

Black Box Medicine:

Machine Intelligence and Algorithms for Clinical Diagnosis and Treatment Decisions

Machine Learning and Image Analysis in Clinical Medicine

pathology	radiology	dermatology	ophthalmology
			




- large scale training sets and classification parameters
- standardized, reproducible and scalable
- 260 million images/day for $1000 GPU

Critical Questions in the Application of ML/AI Platforms in Profiling Large Scale Biomedical Data

- overfitting and bias in datasets used in training
  - error propagation versus automated recognition and exclusion of questionable data
- scale and layered datasets
  - impact of accretion by incorporation of legacy systems of uncertain quality/provenance?
- “black box” effects versus “explainable AI”
  - algorithm evolution neither predicted nor understood by original coders?
  - generative adversarial networks (GANs)

Artificial Intelligence (AI) and Healthcare

- will physicians, payers and patients trust AI?
- how will AI tools be integrated into current work flow or will radical reorganization/re-training be required?
- how will AI platforms alter payment schemes?
- how will AI algorithms/decision analytics be regulated?
- which clinical specialities/processes be at risk of replacement by AI and when?
- how will professional competencies in using AI decision-support tools be defined?
  - MD curriculum, CME
- what new malpractice liabilities will emerge by failure to use/interpret AI platforms

A Pending Transition in Biomedical Research and Clinical Care Decisions?

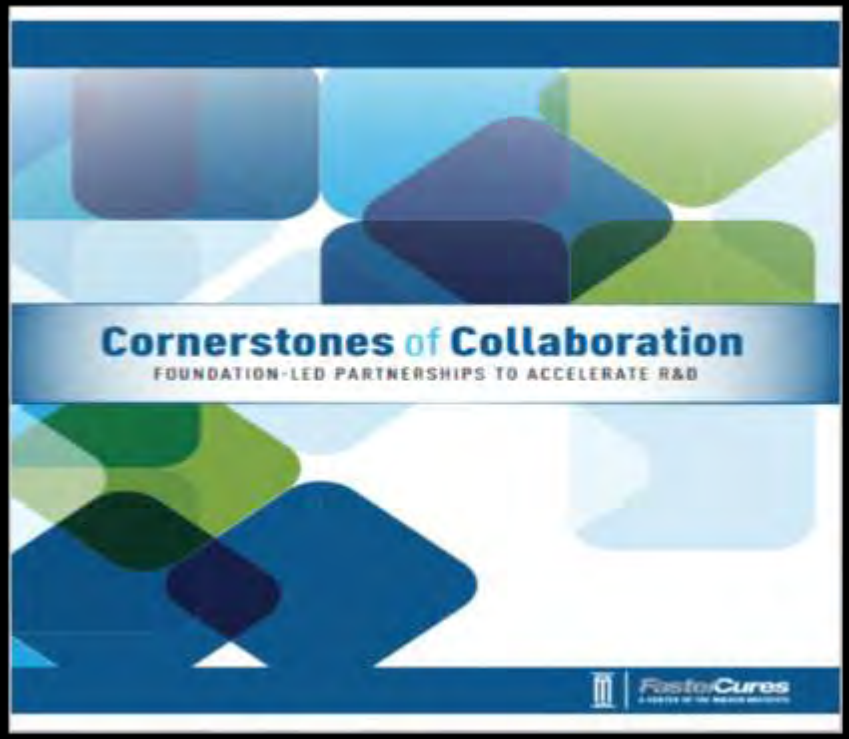
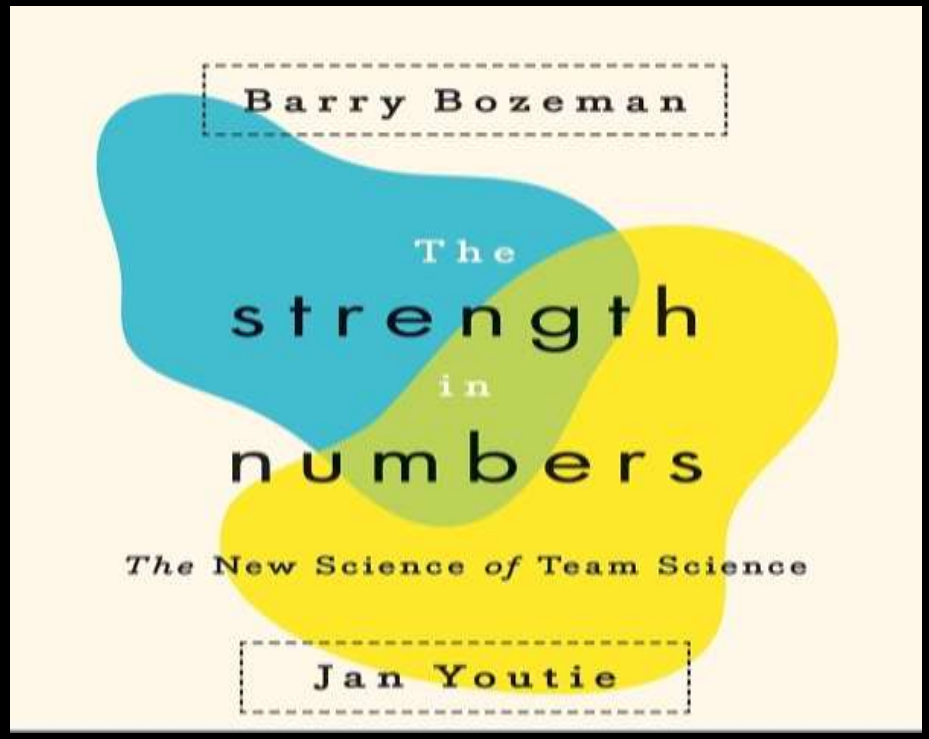
COLLABORATIVE ENVIRONMENTS

Consortium Sandbox: Building and Sharing Resources

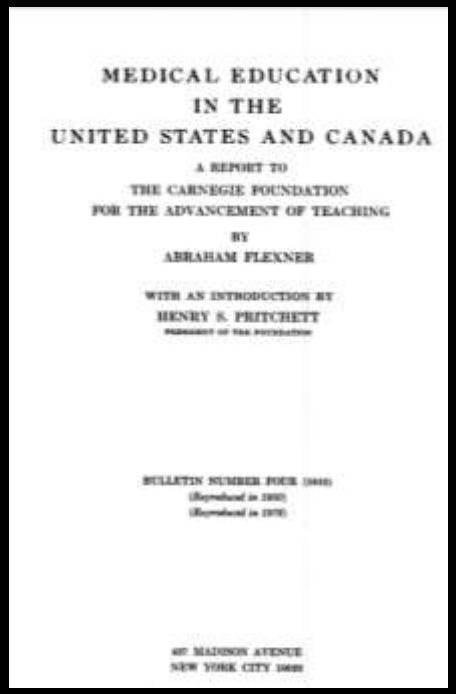
Mark D. Lim

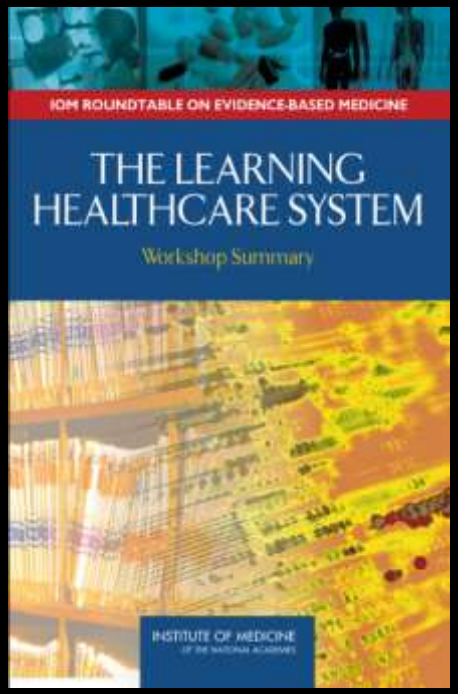
Some common challenges of biomedical product translation—scientific, regulatory, adoption, and reimbursement—can best be addressed by the broad sharing of resources or tools. But, such aids remain undeveloped because the undertaking requires expertise from multiple research sectors as well as validation across organizations. Biomedical resource development can benefit from directed consortia—a partnership framework that provides neutral and temporary collaborative environments for several, oftentimes competing, organizations and leverages the aggregated intellect and resources of stakeholders so as to create versatile solutions. By analyzing 369 biomedical research consortia, we tracked consortia growth around the world and gained insight into how this partnership model advances biomedical research. Our analyses suggest that research-by-consortium provides benefit to biomedical science, but the model needs further optimization before it can be fully integrated into the biomedical research pipeline.

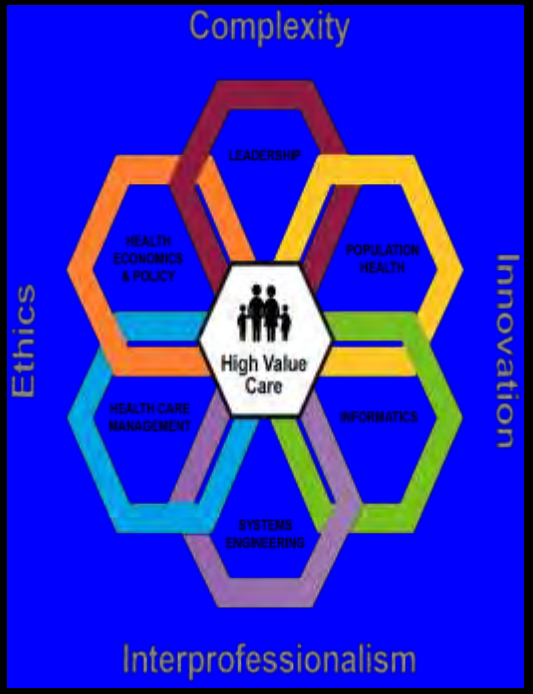




Major Transitions in Medical Education and Healthcare







1910-present

(science-centric)

2000 - present

healthcare as a learning system (data-centric)

2015 - ?

network topologies and dynamics in complex adaptive systems (network-centric): major disruptions in education, R&D and care delivery

Imbalances in Strategies for Comprehensive Cancer Control

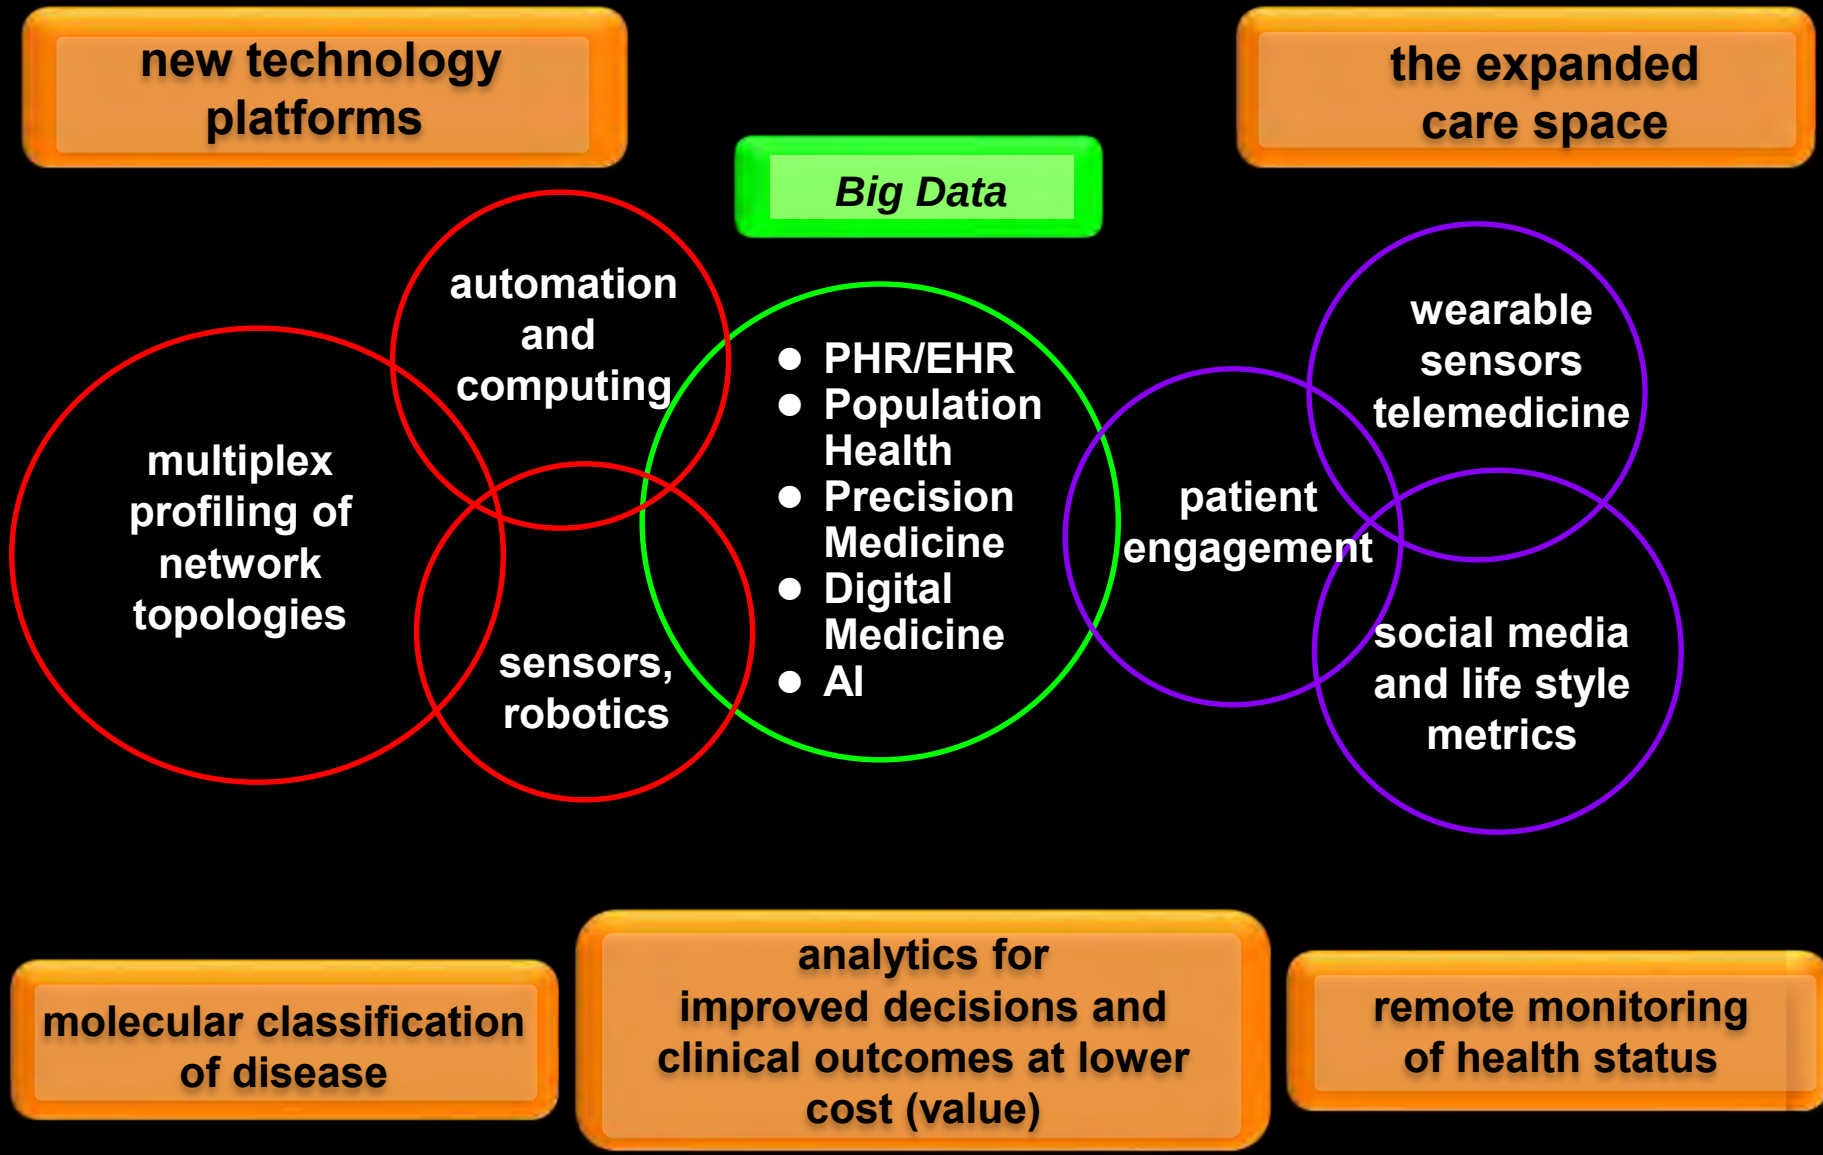
- between investment in cancer prevention versus treatment
- between aggressive non- I/O treatment regimens with curative intent but limited efficiency versus supportive care and palliation
- between cost of therapeutics versus meaningful clinical outcomes and QOL (value)
- between cancer control in HIC and MIC/LIC

Imbalances in Strategies for Comprehensive Cancer Control

between the intellectual rationale of precision oncology and translation into routine clinical practice

between limited availability, analysis and use of population-based of RWE versus comprehensive, data-driven analysis, and robust decision-support systems

The Evolution of Cancer Care: Precision Oncology and Digital Medicine



Cancer As a Complex Adaptive System: Legacy of 32 Years of Prescient Perspectives Still Alarmingly Ignored

"It may also be necessary to re-evaluate how cancer is perceived, not only as a disease but as a biological system."

E.D. Schwab and K.J. Pienta
Medical Hypotheses (1996) 47, 235

"The cancer biology community by itself is unprepared to solve the difficult transdisciplinary problems such as biological complexity, information transfer and tumor cell evolution."

Ann Barker (2008)
NCI PSOP Meeting Summary

"Learning to manage cancer is learning to manage the evolutionary process."

Dr. Richard L. Schilsky
CMO, ASCO
